

Drawing and digital design

When designing a calculator's user interface (UI), it's essential to consider several key factors to ensure a user-friendly and effective design. The factors are User Needs and Expectations, Functionality, Layout and Organization, Ease of Use and Accessibility. used Figma to draw the outlines.

From a UX perspective is a simple calculator, that anyone can use and interact with. Most of all this is a very user-friendly web application.

Development

In this task, creating the calculator took me 2 and 15 min, using HTML, CSS and JavaScript in the visual studio environment. The calculator can count sums, subtraction, division, multiplying and percentages. The web application is responsive and supports all devices given in inspect settings. Every function on the JavaScript side has a comment to let the reader know what's going on.

Explanation

1. HTML:

- The structure of the calculator with buttons for digits, operations, and additional controls.

2. CSS:

- Basic styling to ensure a consistent look and feel.
- Flexbox and grid layouts are used for organizing buttons.
- Different styles for light and dark themes.

3. JavaScript:

- Handles the functionality of the calculator.
- Functions to append values to the display, clear the display, perform calculations, and toggle between light and dark themes.
- Keyboard support for accessibility.
